

partner of choice

The Port of Wilmington, DE handles nearly five million tons of cargo a year. In August 2002, the Port was selected as the first East Coast seaport in the U.S. to deploy the Transportation Worker Identification Credential, a smart card protocol proposed by the TSA. To implement this important initiative, Port management selected security integrator Advantech and Honeywell as their partners of choice. The Honeywell solution allowed

Advantech to leverage the existing security infrastructure to help contain costs while providing a scalable architecture that supported the evolving needs of the Port. The result is a system that enhances commerce, protects privacy and improves security at one of the busiest gateways on the East Coast.
